Effect of Motor Vehicle Importation on Indigenous Automobile Manufacturer in Nigeria Using Statistical Process Control Method

Raimi Oluwole Abiodun1 & Nenuwa Isaac Omosule

Abstract—The study examined the annual production unit of motor vehicles of selected foreign countries manufacturers on how it affects the indigenous automobile manufacturer in Nigeria. The study employed data from Organization Internationale des Constructeurs d’Automobiles (OICA) using time series period of seven (7) years between 2008 and 2014 which is analyzed using statistical process control method with the aid of a statistical software known as MINITAB 16. The findings in the study which is investigated through the mean chart (X̄) and standard deviation chart (S) shows that production unit in the selected countries is under control through the quality of their motor vehicles been produce which is affecting indigenous manufacturers in the country as a result of their obsolete technology in place in most of the manufacturing industry. It is therefore recommended that the government should re-shape the indigenous automobile industry for better so that they can compete with their foreign counterparts in the automobile manufacturing industry.

Index Terms—Motor vehicle, Manufacturer, Mean chart, Standard deviation chart

I. INTRODUCTION

The Nigeria automobile indigenous industry was born with greater potentials and resounding expectations so as for her to compete globally and hold her head high with countries that they shares common fate with like Saudi Arabia, Iran, Brazil and South Africa whom are having crude oil as their main source of budget revenue. But it is quite unfortunate that the industry is not performing well as expected by falling into a quagmire of decay.

The automobile indigenous industry which should serves as a stimulus to the development of other basic industries in the country such as machine tool, iron and steel, petro-chemical, rubber, etc., is very low in terms of it performance at various areas.

The automobile industry in Nigeria back to the early 1960’s was pioneered by some private companies through the establishment of auto assembly plants that used completely knocked down (CKD) or semi-knocked (SKD) parts. However, this was on a very limited scale in terms of output of production. During this period, the Nigerian automobile industry had the capacity to produce 108,000 cars, 56,000 commercial vehicles and 6000 tractors annually. However, from the 1980’s, the industry shrank from 90 percent capacity utilization to 10 percent capacity utilization. Despite federal government regulation to increase tariff and custom duties on imported motor vehicle into the country so as to discourage importers who purchase motor vehicle from abroad, it is still clearly observed that demand on importation of motor vehicle is very high. Consequently, this in turn reduce standardization of technology and a less efficient utilization of costly equipment in the indigenous industry. Other issues that serves as a limitation to the industry is lack of patronage both from Nigerians and the government, poor and non conducive operating environment, poor capital base, poor performance of local content suppliers, as well as obsolete technology.

Farzana et al., (2009) investigated on the level of improvement of manufacturing performance in manufacturing companies by adopting hourly data system and statistical process control practices. The purpose of their research work is to find out the frequencies and time duration of machine breakdowns as well as the major causes of breakdowns affecting productivity. Their findings revealed that any breakdown can cause a huge cost and the best approach to address any breakdown is the preventive measure.

Parkesh et al., (2013) analyzed the importance of statistical process control as it is largely used in industries for monitoring the process parameters. The analysis of their study revealed that SPC is a standard method for visualizing and controlling processes on the basis of measurements of randomly selected samples. It is also revealed in their study that the decisions about what needs to be improved, the possible methods to improve it, and the steps to take after getting results from the charts are all made by human and based on wisdom and experience.

Mostafaieipour et al., (2012) introduced statistical process control techniques in Yazd ceramic tile manufacturing plant in Iran for reducing unwanted ceramic tile defects and wastages. Their research study was able to present a complete process to help manufacturer identify defects for process improvement with immediate benefits for the current development cycle in the plant.

Prajapati (2012) attempted on some implementation of SPC techniques in an automobile industry that is offering its customers the widest and latest range of sealing solutions for motor vehicles. Their research study was able to present a complete process to help manufacturer identify defects for process improvement with immediate benefits for the current development cycle in the plant.

that the proposed approach can be used for repetitive metallurgical processes and that the statistical analysis can bring the real economic benefits.

II. METHODOLOGY
The data for this research study was extracted from the official website of International Organization of Motor Vehicle Manufacturers. They are also known as Organization Internationale des Constructeurs d’Automobiles (OICA). Importations of motor vehicle were strictly considered from country where Nigeria mostly imports from. And these countries are Japan, France, Germany, China, South Korea and Belgium respectively. The annual production unit of motor vehicle mostly imports from. And these countries are Japan, France, Germany, China, South Korea and Belgium respectively. The annual production unit of motor vehicle from these countries were collectively considered using statistical process control (SPC) method. The purpose of using the SPC method was to investigate the quality of production of these countries in terms of their capacity as it affects the measure of shrinkage of our indigenous automobile industry. The mean chart (\( \bar{X} \)) and standard deviation chart (\( S \)) will basically be used to analyse this effect.

III. DATA PRESENTATION
The research data for this study covers a time series period of seven (7) years. This comprises of annual production unit of motor vehicle from countries where Nigeria mostly imports from.

IV. DATA ANALYSIS
The data for this study were analysed using statistical process control method which will basically comprises of mean chart (\( \bar{X} \)) and standard deviation chart (\( S \)) for the purpose of this research with the aid of a statistical software known as Minitab 16. Figure 1 shows the mean chart (\( \bar{X} \)) and standard deviation chart (\( S \)) of Table 1.

V. DISCUSSION OF FINDINGS
All of the points on the control chart are within the control limits. Thus the process mean and process standard deviation appear to be stable. Thus, is in control. The process mean (\( \bar{X} \)) is 6686089 and average standard deviation (\( S \)) is 6307571. There is a partial random dispersion of the collective production unit of the motor vehicle of the selected countries above and below the mean. This implies that motor vehicle production in these prominent countries where Nigeria imports from shows a significant impact in terms of their quality and capacity. Nigerians relies so much on importation of motor vehicle from this selected countries rather than showing interest to their own indigenous made own car in the country. It can also be observed that there is no significant record of annual motor vehicle production unit in Nigeria between 2009 and 2014 from the website of International Organization of Motor Vehicle Manufacturers. This has a negative impact on the indigenous automobile industry and a strong positive effect on countries where Nigeria mostly import from as shown in the chart in Figure 1. This is as a result of a unique confidence most Nigeria derived from foreign motor vehicles imported into the country. This has affected the automobile plant of our indigenous manufacturing company to shut down and be converted to production halls for mere rectification bay and dealership showrooms of imported fully built unit of motor vehicles from this selected country. This is in agreement with the research work done by Cornelius (2011) that automobile plants in Nigeria are merely coupling vehicle parts produced overseas with little input to the component production of major units.
VI. CONCLUSION

The quality of the types of motor vehicle produced in Nigeria is of sub-standard and can hardly compete with foreign automobile manufacturers in recent times. There has been no significant patronage to indigenous made motor vehicles by Nigerians due to the lack of confidence they are having in the technology structure of the automobile industry. Most Nigerians prefer purchasing motor vehicle from foreign manufacturers irrespective of the cost attached to it during clearing because of the trust and confidence they are having on foreign technology of the automobile industry abroad. However, this has crippled the production level of the indigenous automobile Nigeria industry with no significant level of production between 2009 and 2014. It is now important and calls for urgent necessity from the government and investors that the indigenous automobile industry should be well sharpen to standard so as to compete with their foreign counterparts in the automobile manufacturing industry.
